## Self-driving rides

Hash Code 2018, Online Qualification Round

## Problem Statement

### Problem Representation

Notes

---

---

---

---

---

---

---

---

---

---

Notes

---

---

---

---

---

---

---

---

---

---

## Problem Statement

### Problem Representation

- $R, C$  number of rows and columns in the grid
- $F$  size of the fleet (number of vehicles)
- $N$  number of rides
  - $\forall r \in [1, N], s_r, f_r$ : starting and ending points of the ride
  - $\forall r \in [1, N], e_r, l_r$ : earliest start time and latest end time of the ride
- $B$  bonus for rides that start on time
- $T$  time horizon
- Score for a ride: distance of the ride plus a potential bonus if it starts on time

**Objective:** Maximize the score for all completed rides

Notes

---

---

---

---

---

---

---

---

---

---

## Example

### Exemple

Notes

---

---

---

---

---

---

---

---

---

---

## Example

### Exemple

- Grid with 3 rows and 4 columns
- 2 vehicles
- 3 rides
  - $s_0 = (0, 2), f_0 = (2, 2), e_0 = 2, l_0 = 14$
  - $s_1 = (2, 1), f_1 = (0, 1), e_1 = 4, l_1 = 14$
  - $s_2 = (1, 0), f_2 = (3, 2), e_2 = 0, l_2 = 14$
- Bonus: 2
- Time horizon: 15 time steps

## Problem Statement

### Variables?

- The rides assigned to the vehicles
  - $\forall v \in [0, F - 1], L_v$ : the list of rides assigned to vehicle  $v$

## Notes

---

---

---

---

---

---

---

---

---

---

## Notes

---

---

---

---

---

---

---

---

---

---

## Local Search

### Principle

- Start from an initial solution
- At each step, modify the solution
  - trying to improve the value of the objective function
  - hoping to achieve the global optimum
- Local approach
  - depending on the problem, no guarantee of optimality (heuristic)
  - low cost

### Initial solution

- “Empty” solution
- Random solution
- Solution from a greedy algorithm

Notes

---

---

---

---

---

---

---

---

---

---

## Local Search

### Principle

- Start from an initial solution
- At each step, modify the solution
  - trying to improve the value of the objective function
  - hoping to achieve the global optimum
- Local approach
  - depending on the problem, no guarantee of optimality (heuristic)
  - low cost

### Modifications

- Add a ride to a vehicle
- Remove a ride from a vehicle
- Swap rides within a vehicle
- Swap rides between 2 vehicles

Notes

---

---

---

---

---

---

---

---

---

---

## Local Search

### Principle

- Start from an initial solution
- At each step, modify the solution
  - trying to improve the value of the objective function
  - hoping to achieve the global optimum
- Local approach
  - depending on the problem, no guarantee of optimality (heuristic)
  - low cost

### Improving the score

Need for a function computing the score

Notes

---

---

---

---

---

---

---

---

---

---

## Local Search

### Principle

- Start from an initial solution
- At each step, modify the solution
  - trying to improve the value of the objective function
  - hoping to achieve the global optimum
- Local approach
  - depending on the problem, no guarantee of optimality (heuristic)
  - low cost

- 1 Random walk
- 2 Gradient descent
- 3 Tabu Search

Notes

---

---

---

---

---

---

---

---

---

---

## Local Search

### Neighborhood

For a solution, the set of solutions with one modification

### Exemple

- Grid of 3 rows and 4 columns
- 2 vehicles
- Bonus of 2
- Time horizon of 15 time steps
- 3 rides
- $s_0 = (0, 2), f_0 = (2, 2), e_0 = 2, l_0 = 14$
- $s_1 = (2, 1), f_1 = (0, 1), e_1 = 4, l_1 = 14$
- $s_2 = (1, 0), f_2 = (3, 2), e_2 = 0, l_2 = 14$

Notes

---

---

---

---

---

---

---

---

---

---

## Local Search

### Neighborhood

For a solution, the set of solutions with one modification

### Exemple

- $s_0 = (0, 2), f_0 = (2, 2), e_0 = 2, l_0 = 14$
- $s_1 = (2, 1), f_1 = (0, 1), e_1 = 4, l_1 = 14$
- $s_2 = (1, 0), f_2 = (3, 2), e_2 = 0, l_2 = 14$

$L_0 = [], L_1 = []$

score : 0

$L_0 = [0]$ (4, (2, 2))	$L_1 = []$ (0, (0, 0))	score: 4
$L_0 = []$ (0, (0, 0))	$L_1 = [0]$ (4, (2, 2))	score: 4
$L_0 = [1]$ (6, (0, 1))	$L_1 = []$ (0, (0, 0))	score: 4
$L_0 = []$ (0, (0, 0))	$L_1 = [1]$ (6, (0, 1))	score: 4
$L_0 = [2]$ (5, (3, 2))	$L_1 = []$ (0, (0, 0))	score: 4
$L_0 = []$ (0, (0, 0))	$L_1 = [2]$ (5, (3, 2))	score: 4

Notes

---

---

---

---

---

---

---

---

---

---

## Local Search

### Neighborhood

For a solution, the set of solutions with one modification

### Exemple

- $s_0 = (0, 2), f_0 = (2, 2), e_0 = 2, l_0 = 14$
- $s_1 = (2, 1), f_1 = (0, 1), e_1 = 4, l_1 = 14$
- $s_2 = (1, 0), f_2 = (3, 2), e_2 = 0, l_2 = 14$

$L_0 = [0], L_1 = []$

score: 4

$L_0 = []$	$(0, (0, 0))$	$L_1 = []$	$(0, (0, 0))$	score: 0
$L_0 = []$	$(0, (0, 0))$	$L_1 = [0]$	$(4, (2, 2))$	score: 4
$L_0 = [0, 1]$	$(7, (0, 1))$	$L_1 = []$	$(0, (0, 0))$	score: 6
$L_0 = [0]$	$(4, (2, 2))$	$L_1 = [1]$	$(6, (0, 1))$	score: 8
$L_0 = [0, 2]$	$(11, (3, 2))$	$L_1 = []$	$(0, (0, 0))$	score: 8
$L_0 = [0]$	$(4, (2, 2))$	$L_1 = [2]$	$(5, (3, 2))$	score: 8

Notes

---

---

---

---

---

---

---

---

---

---

---

---

## Local search

### Which neighbor to choose?

- Randomly
- The best
- One of the best

### Gradient descent

- We start with an initial solution
  - At each step, we move towards a solution in the neighborhood **strictly improving** the objective
  - You can get stuck in local minima
- ⇒ Start again from another solution

Notes

---

---

---

---

---

---

---

---

---

---

---

---

## Local search

### Restarts

- Random solution
- “Empty” solution, in which a certain percentage of variables is fixed as in the best solution found so far
  - 5%, 10%, 20%

### No improvement

- We move towards a solution in the neighborhood **without improving** the objective
  - ⇒ Don't be a goldfish

Notes

---

---

---

---

---

---

---

---

---

---

## Tabu Search

### Principle

- We start from a solution  $s$ .
- We move towards **the best** solution in the neighbourhood which is not **forbidden**
- Add  $s$  to the forbidden solutions for the next  $m$  iterations

### Memory

- Prohibiting solutions can be memory-intensive
- Instead we forbid movements
  - If  $m$  too small  $\Rightarrow$  blocking search around a local optimum
  - If  $m$  too large  $\Rightarrow$  risk of missing solutions

Notes

---

---

---

---

---

---

---

---

---

---

## Tabu Search

$m = 3$

$L_0 = []$	$L_1 = []$	score: 0
